

Learning Python Basics

Chapter 1: Variables and Types

A variable is a named location in memory that stores a value.

In Python, you create a variable by assigning a value to a name.

An integer is a whole number. A string is a sequence of characters.

```
age = 25
```

```
name = "Ada"
```

```
print(name, age)
```

The print function writes its arguments to the console.

Chapter 2: Functions

A function is a reusable block of code that performs one task.

Functions help you avoid repeating yourself and make code testable.

```
def greet(name):  
    return "Hello, " + name  
message = greet("World")  
print(message)
```

The return statement sends a value back to the caller.

Chapter 3: Loops

A for loop repeats a block of code once for each item in a sequence.

A while loop repeats as long as its condition remains true.

```
for i in range(3):
```

```
    print(i)
```

```
count = 0
```

```
while count < 3:
```

```
    count = count + 1
```

Loops can be nested inside other loops.
